# Harmonic functions

The Laplacian on  $\mathbb{R}^n$ :  $\Delta = \frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_2^2} + \cdots + \frac{\partial^2}{\partial x_n^2}$

$\Delta u = 0 \implies u$  is real-analytic

$$\therefore u(x_1, x_2, \dots, x_n) \rightsquigarrow \widehat{u}(z_1, z_2, \dots, z_n)$$

More precisely,

$$\begin{array}{ccccc} \mathbb{R}^n & \supseteq_{\text{open}} & U & \xrightarrow{u} & \mathbb{R} \text{ or } \mathbb{C} \\ & \cap & \cap & & \cap \\ \mathbb{C}^n & \supseteq_{\text{open}} & \widehat{U} & \xrightarrow{\widehat{u}} & \mathbb{C} \end{array}$$

FAQ:

Depends on  $u$ ?

How big?

## 2 dimensions

$$\Delta = \frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_2^2} = \left( \frac{\partial}{\partial x_1} - i \frac{\partial}{\partial x_2} \right) \underbrace{\left( \frac{\partial}{\partial x_1} + i \frac{\partial}{\partial x_2} \right)}_{\text{Cauchy-Riemann}}$$

- $\mathbb{R}^2 \supseteq_{\text{open}} U \xrightarrow{u} \mathbb{C}$  harmonic
  - $U$  simply-connected
- }  $\implies$

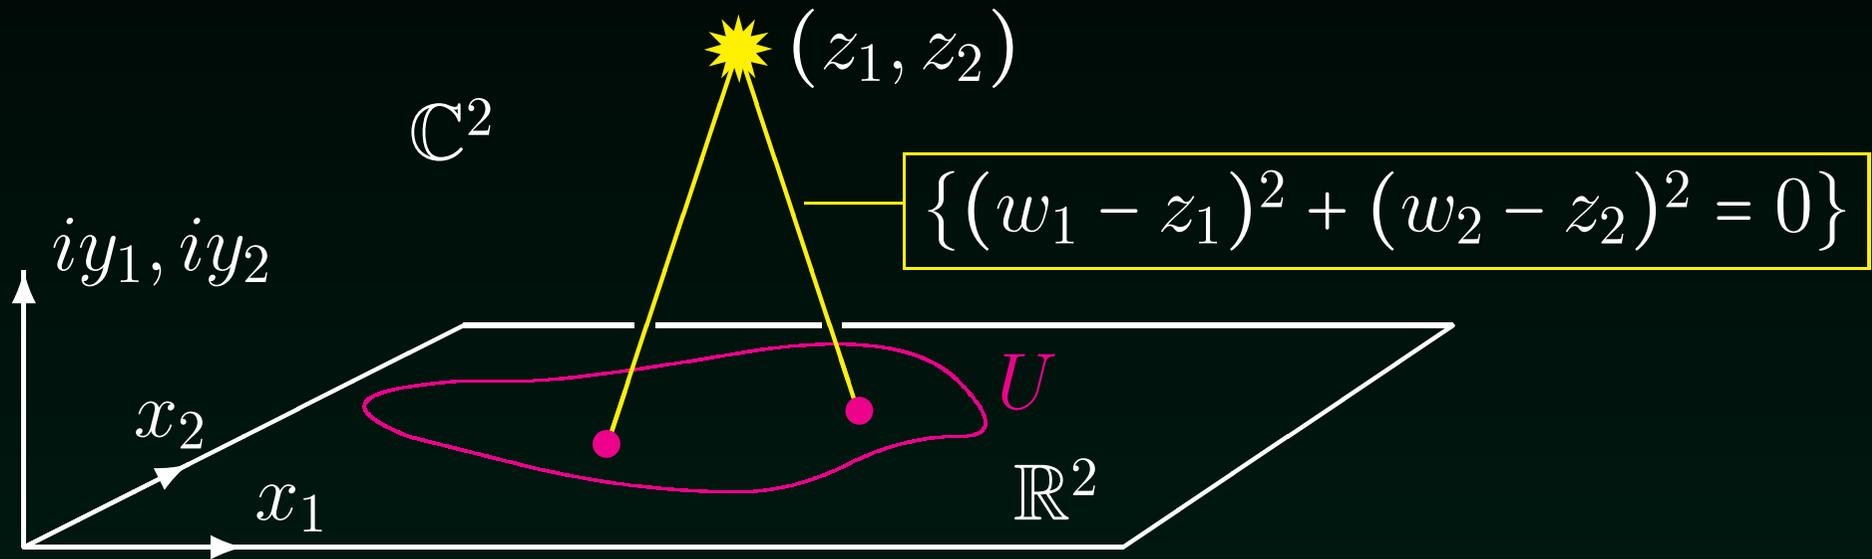

$$u(x_1, x_2) = \underbrace{f(x_1 + ix_2)}_{\text{holomorphic}} + \underbrace{g(x_1 - ix_2)}_{\text{holomorphic}}$$

$$\therefore \widehat{u}(z_1, z_2) = f(z_1 + iz_2) + g(z_1 - iz_2)$$

where it makes sense:  $z_1 + iz_2 \in U$  and  $z_1 - iz_2 \in \overline{U}$

## 2 dimensions cont'd

$$\boxed{z_1 + iz_2 \in U} \text{ and } \boxed{z_1 - iz_2 \in \overline{U}} \iff$$

$\therefore$  all  $u$  harmonic on  $U$  extend to  $\tilde{u}$  holomorphic on

$$\tilde{U} \equiv \{z \in \mathbb{C}^2 \text{ s.t. } \mathcal{N}(z) \cap \mathbb{R}^2 \subset U\}$$

where  $\mathcal{N}(z) = \{w \in \mathbb{C}^2 \text{ s.t. } \|w - z\|^2 = 0\}$  Null 'Cone'

## 2 dimensions concl'd

If  $U \subseteq \mathbb{R}^2$  is simply-connected then

- all harmonic functions on  $U$  extend to  $\tilde{U} \subseteq \mathbb{C}^2$ ,
- $\tilde{U}$  is connected (and simply-connected),
- $\tilde{U}$  is maximal in this respect  $\star$ .

$\tilde{U}$  is called the harmonic hull of  $U$ .

$\star$  consider  $\log \|z - x\|^2$  for  $x \in \partial U$ .

If  $U \subset \mathbb{R}^2$  is multiply-connected, it does not have a harmonic hull: consider

$\log \|z - x\|^2$  for  $x \in \mathbb{R}^2 \setminus U$  surrounded by  $U$ .

# 4 dimensions

## Bateman's formula

$$u(x) = \oint_{\gamma} f((x_1 + ix_2) + (ix_3 + x_4)\zeta, (ix_3 - x_4) + (x_1 - ix_2)\zeta, \zeta) d\zeta$$

a holomorphic function of 3 variables  
a closed contour in the complex plane

Differentiation under the integral sign  $\implies$

$$\Delta u = 0$$

## FAQ (circa 1904–1980)

- where is  $f$  defined?
  - where is  $\gamma$  located?
  - which  $u$  arise in this way?
- } answer by means of Penrose transform

Suspend disbelief!

# 4 dimensions cont'd

Naive use of Bateman

$$u(x) = \oint_{\gamma} f \left( (x_1 + ix_2) + (ix_3 + x_4)\zeta, (ix_3 - x_4) + (x_1 - ix_2)\zeta, \zeta \right) d\zeta$$

$$u(z) = \oint_{\gamma} f \left( (z_1 + iz_2) + (iz_3 + z_4)\zeta, (iz_3 - z_4) + (z_1 - iz_2)\zeta, \zeta \right) d\zeta$$

Perhaps we should insist that

$f(z, \zeta)$  be defined wherever  $f(x, \zeta)$  is defined i.e.

for fixed  $z = (z_1, z_2, z_3, z_4) \in \mathbb{C}^4$ ,

$$L_z \equiv \left\{ \left( (z_1 + iz_2) + (iz_3 + z_4)\zeta, (iz_3 - z_4) + (z_1 - iz_2)\zeta, \zeta \right) \text{ s.t. } \zeta \in \mathbb{C} \right\}$$

$\cap$  WANT!  $\swarrow$  open in  $\mathbb{C}^3$

$$\left\{ \left( (x_1 + ix_2) + (ix_3 + x_4)\zeta, (ix_3 - x_4) + (x_1 - ix_2)\zeta, \zeta \right) \text{ s.t. } x \in U, \zeta \in \mathbb{C} \right\}$$

# What we want

Fix  $z \in \mathbb{C}^4$ . For any  $\zeta \in \mathbb{C}$ , we want to be able to solve

$$\begin{bmatrix} x_1 + ix_2 & ix_3 + x_4 \\ ix_3 - x_4 & x_1 - ix_2 \end{bmatrix} \begin{bmatrix} 1 \\ \zeta \end{bmatrix} = \begin{bmatrix} z_1 + iz_2 & iz_3 + z_4 \\ iz_3 - z_4 & z_1 - iz_2 \end{bmatrix} \begin{bmatrix} 1 \\ \zeta \end{bmatrix}$$

for some  $x = (x_1, x_2, x_3, x_4) \in U \subseteq^{\text{open}} \mathbb{R}^4$ . Necessarily,

$$\det \left( \begin{bmatrix} x_1 + ix_2 & ix_3 + x_4 \\ ix_3 - x_4 & x_1 - ix_2 \end{bmatrix} - \begin{bmatrix} z_1 + iz_2 & iz_3 + z_4 \\ iz_3 - z_4 & z_1 - iz_2 \end{bmatrix} \right) = 0$$

i.e.  $(x_1 - z_1)^2 + (x_2 - z_2)^2 + (x_3 - z_3)^2 + (x_4 - z_4)^2 = 0$

(also if  $\zeta = \infty$ ). This is also sufficient: we require

$$\mathcal{N}(z) \cap \mathbb{R}^4 \subset U \quad \text{where } \mathcal{N}(z) = \text{null cone based at } z$$

# 4 dimensions concl'd

For any  $U^{\text{open, connected}} \subseteq \mathbb{R}^4$ , let

$$\tilde{U} \equiv \{z \in \mathbb{C}^4 \text{ s.t. } \mathcal{N}(z) \cap \mathbb{R}^4 \subset U\}^{\text{connected}}$$

where  $\mathcal{N}(z) = \{w \in \mathbb{C}^4 \text{ s.t. } \|w - z\|^2 = 0\}$  Null Cone

- All harmonic functions on  $U$  extend to  $\tilde{U}$ ,
- $\tilde{U}$  is maximal  $\star$  (harmonic hull).

$\star$  Consider  $1/\|z - x\|^2$  for  $x \in \partial U$ .

NB  $n = 4$  is better than  $n = 2$  if Bateman OK.  
??????????????

# The twistor fibration

Looking at Bateman's formula, consider

$$\begin{array}{ccc} \zeta \in \mathbb{C} \hookrightarrow \mathbb{C}^3 & \text{write } L_x \text{ for the range, where } x \in \mathbb{R}^4 & \\ \downarrow & \Psi & \\ ((x_1 + ix_2) + (ix_3 + x_4)\zeta, (ix_3 - x_4) + (x_1 - ix_2)\zeta, \zeta) & & \end{array}$$

Compactify!  $\mathbb{CP}_1 \hookrightarrow \mathbb{CP}_3$  (still write range as  $L_x$ )

Foliation of  $\mathbb{CP}_3 \setminus \{[* , * , 0 , 0]\} \hookrightarrow \mathbb{CP}_3$

$$\begin{array}{ccc} & \downarrow & \downarrow \tau \text{ submersion} \\ L_x = \tau^{-1}(x) & \mathbb{R}^4 & S^4 \\ & \begin{array}{c} \hookrightarrow \\ \longleftarrow \\ \text{stereographic projection} \end{array} & \end{array}$$

cf. Hopf

# The Penrose transform

Theorem For any  $U^{\text{open}} \subseteq \mathbb{R}^4$

$$\mathcal{P} : H^1(\tau^{-1}(U), \mathcal{O}(-2)) \xrightarrow{\cong} \{u : U \rightarrow \mathbb{C} \text{ s.t. } \Delta u = 0\}.$$

Interprets Bateman's formula and answers FAQ!

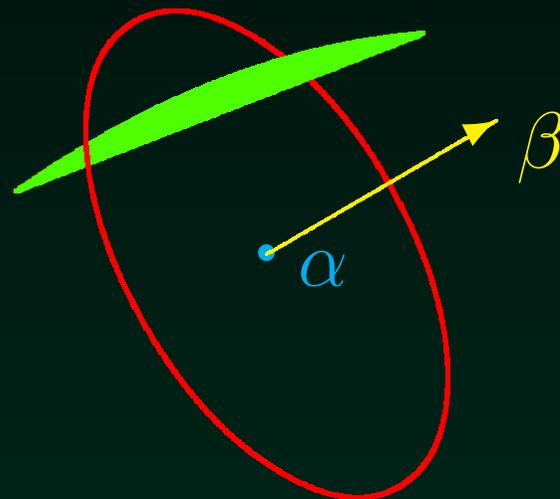

- $\mathcal{N}(z) \cap \mathbb{R}^4 \subset U \iff L_z \subset \tau^{-1}(U)$
- $\tilde{U}$  = harmonic hull, as suspected
- For  $U^{\text{open}} \subseteq S^4$ ,  $\Delta \rightsquigarrow \Delta - \frac{1}{6}R$  (Yamabe)
- OK in higher even dimensions (M.K. Murray).

# Geometry of the harmonic hull

For  $z = \alpha + i\beta \in \mathbb{C}^n$

$$\begin{aligned}\mathcal{N}(z) \cap \mathbb{R}^n &= \{x \text{ s.t. } \|x - z\|^2 = 0\} \\ &= \{x \text{ s.t. } |x - \alpha|^2 = |\beta|^2 \ \& \ (x - \alpha) \cdot \beta = 0\}\end{aligned}$$

**NB**  $\mathcal{N}(z) \cap \mathbb{R}^n = \mathcal{N}(\bar{z}) \cap \mathbb{R}^n$

# Odd dimensions

$U^{\text{open, connected}} \subseteq \mathbb{R}^{\text{odd}}$  need not have a harmonic hull!

Example  $\mathbb{R}^3 \setminus \{0\}$  Reasons

Recall  $\mathbb{C}^3 \ni z \rightsquigarrow \mathcal{N}(z) \cap \mathbb{R}^3 \equiv \text{Circle}(z) \rightsquigarrow \text{Disc}(z)$

- OK extension to  $\{z \text{ s.t. } \text{Disc}(z) \neq 0\}$   
Aronszajn, Creese, and Lipkin
- $f(x) \rightsquigarrow \frac{1}{\sqrt{1-2r \cdot x + |r|^2|x|^2}} f\left(\frac{x-r|x|^2}{1-2r \cdot x + |r|^2|x|^2}\right)$  harmonic ✓
- Hence should extend to  $\mathbb{C}^3 \setminus \{z_1^2 + z_2^2 + z_3^2 = 0\}$
- But  $1/\sqrt{z_1^2 + z_2^2 + z_3^2}$  branches!!

Cf. Huygens, Kirchhoff, et cetera
